

Customizing RDA for local applications

Gordon Dunsire, RDA Technical Team Liaison Officer
Presented at CC:DA Meeting, ALA Annual,
June 22, 2019, Washington, D.C.

Overview

Application profiles

Local vocabulary encoding schemes

Local string encoding schemes

Application profile

A specification of the metadata that is used in an application

A specification may include the entities, elements, and vocabulary encoding schemes that are used, and the mandatory and repeatable status of elements

May also include the preferred recording method

Format

Structured: tabular layout is common

Row = specified element

Column = profile characteristic of element

Element	Mandatory?	Repeatable?	VES	SES	Recording
Name of person	Yes	Yes	n/a	n/a	Unstructured (normalized)
Date of birth	Yes	No	n/a	ISO 8601	Structured
Related RDA entity of person	Yes	Yes	See RDA Entity	See RDA entity	IRI

RIMFF4 template

The screenshot shows a software window titled "P -- person mandatory.nt -- *". The window has a menu bar with "File", "Edit", "View", "Options", "Windows", and "Help". Below the menu bar is a text input field containing "[tba]". The main content area displays a table titled "RDA Person". The table has three columns: "ELEMENT LABEL", "TEXT", and "RECORDING METHODS". The table contains four rows of data:

	<i>ELEMENT LABEL</i>	<i>TEXT</i>	<i>RECORDING METHODS</i>
	RIMMF identifier	person mandatory	
	Name of person	Repeatable	Unstructured (normalized)
	Date of birth	Not repeatable	Structured (ISO 8601)
I	Related rda entity of person		IRI

At the bottom right of the window, there is a teal bar with the text "WEMI Links" and a button labeled "R-Tree".

Layered (nested profile)

Coherent description of an information resource

Resource description entity
Minimum description of a resource entity

Effective description
A coherent description following requirements

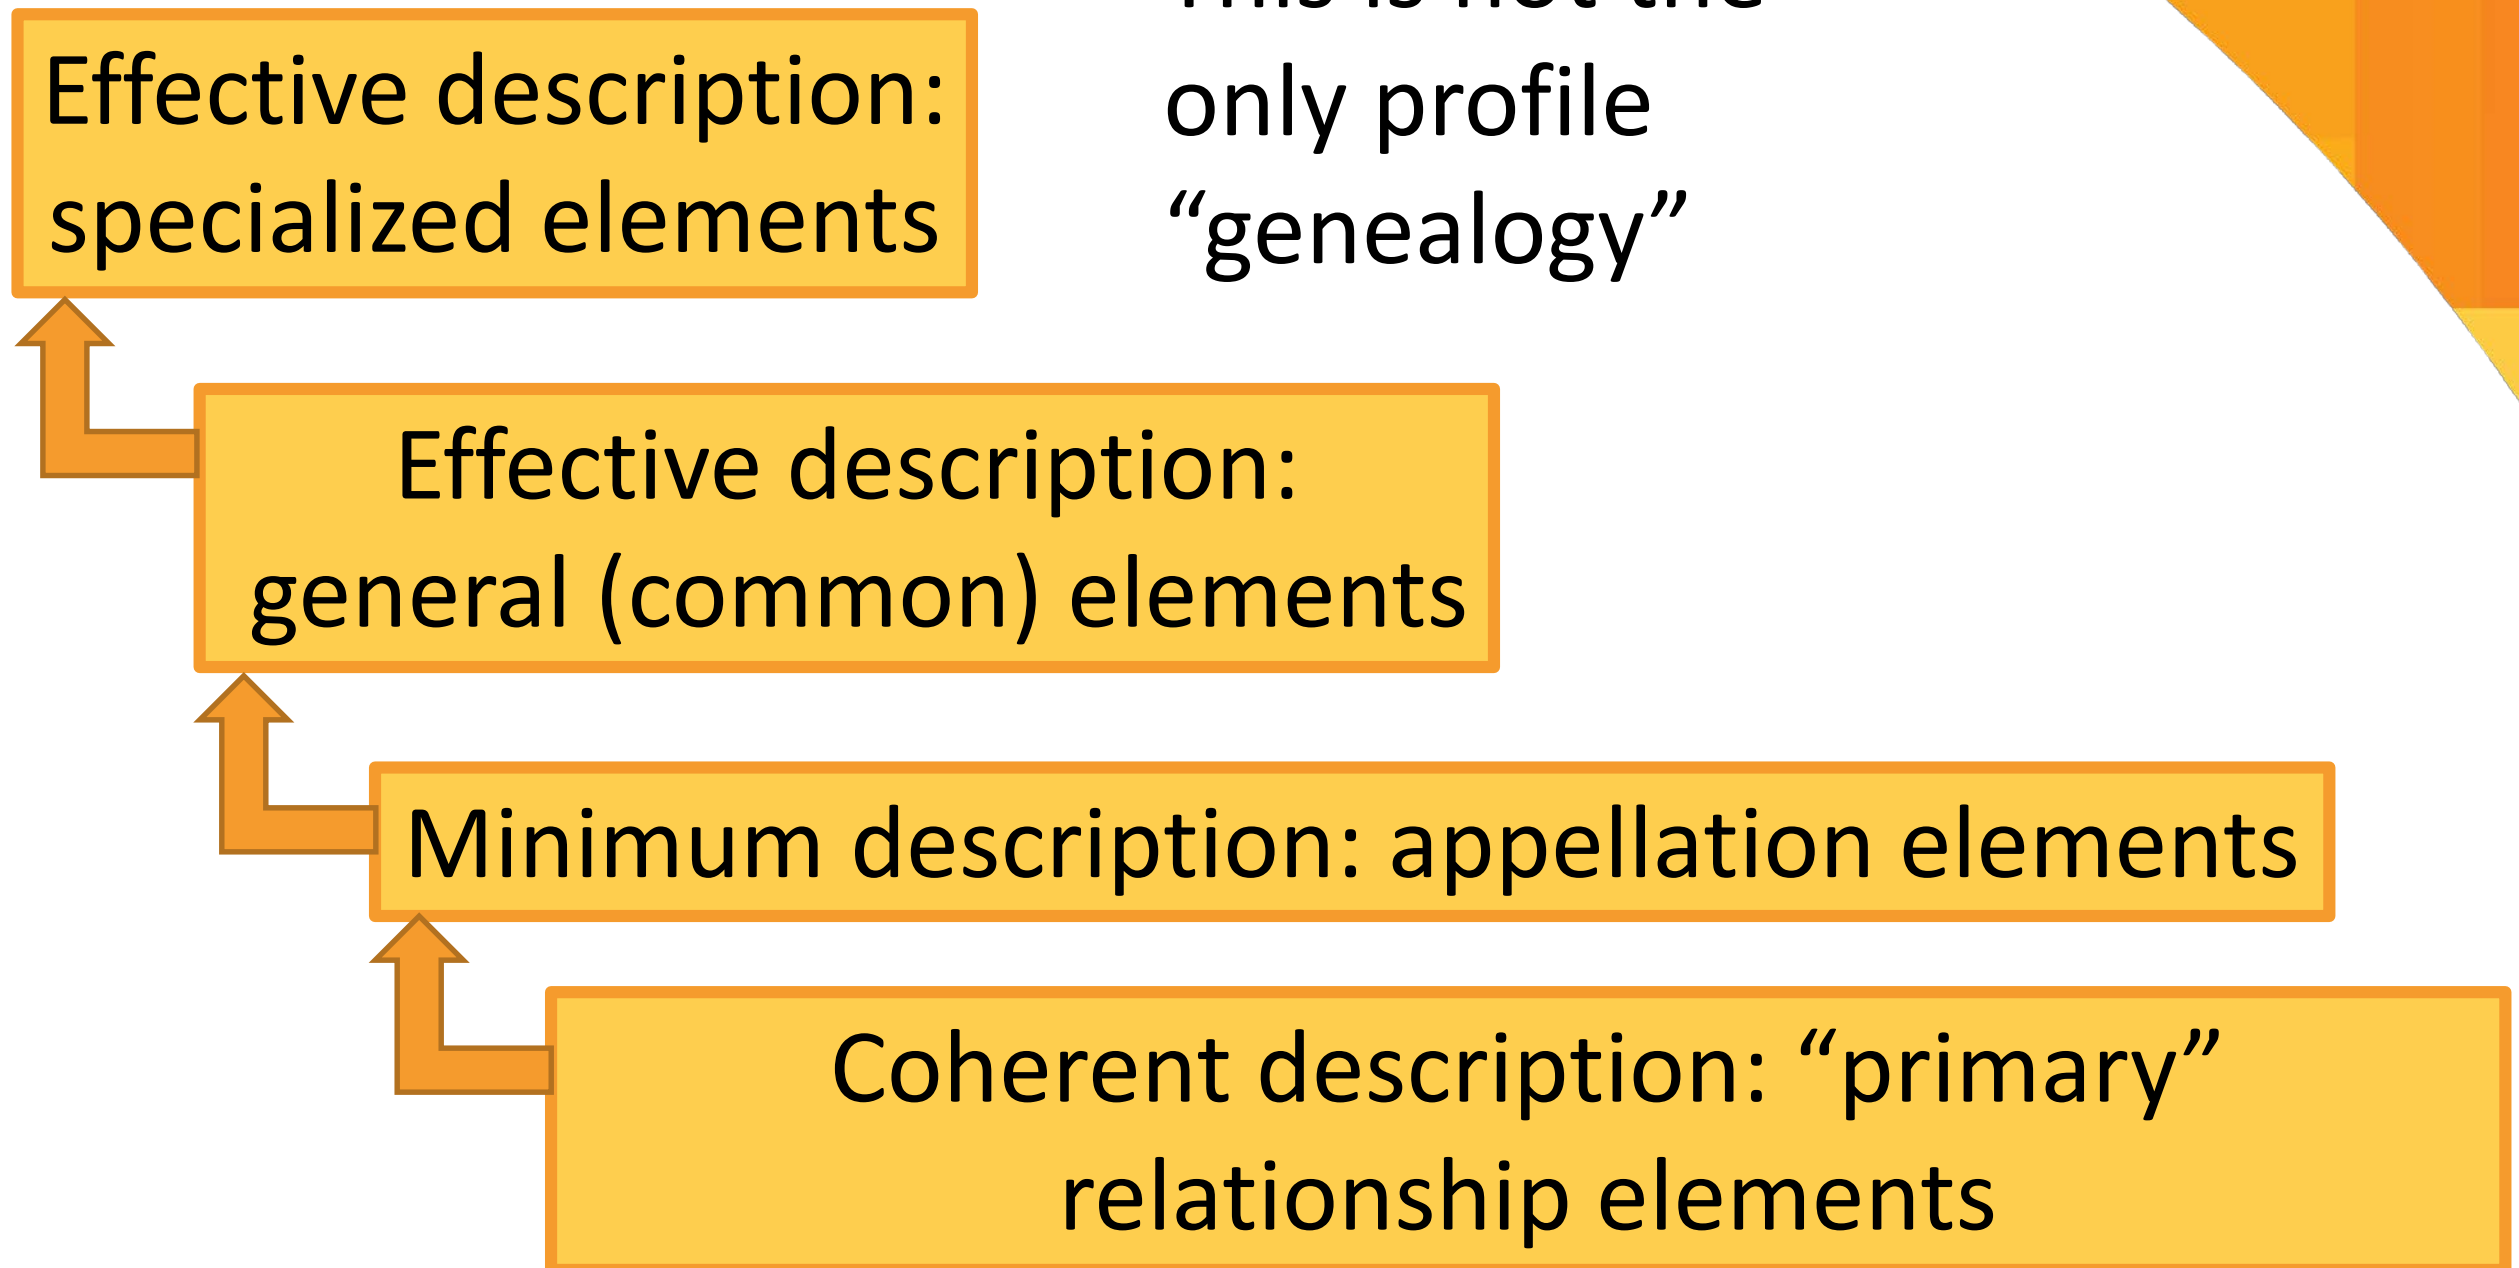

Effective description:
general and specialized elements

Minimum description: appellation elements

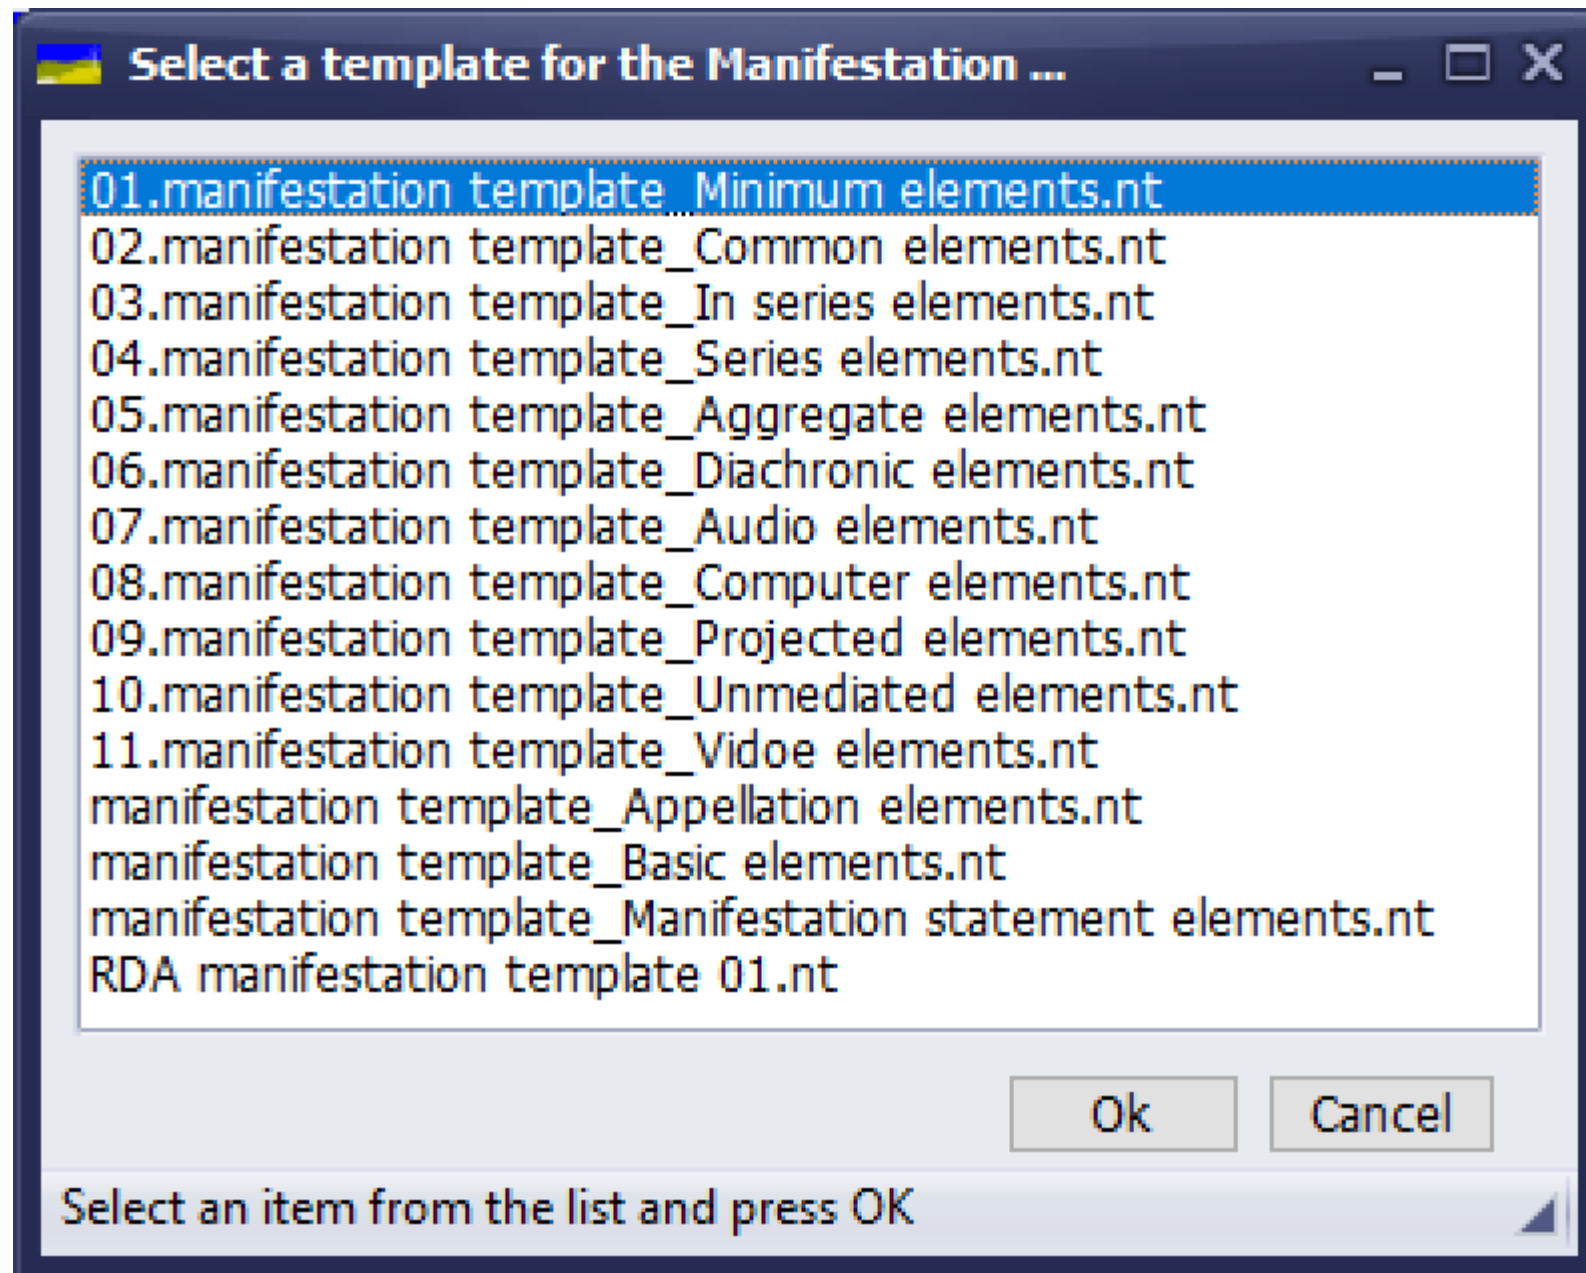

Coherent description: “primary” relationship elements

Profile inheritance

This is not the only profile “genealogy”

Profile management

Vocabulary encoding scheme

VES: Provides controlled values for an element

Preferred label (structured description)

Notation (identifier)

IRI

Local VES

Must be compatible with the semantics of the RDA element

Scope/coverage

Should be mappable to the RDA VES (if there is one)

Local term/concept is broader, narrower, or equivalent to RDA concept

String encoding scheme

SES: Specifies how a string value of an element is constructed

Values of other elements (variable)

Boilerplate (fixed)

Order (fixed)

Punctuation/delimiters (fixed)

String construction

Example: Authorized access point for place

“Main Street (Washington, D.C.)”

preferred name of place	“Main Street”
+ punctuation	“(“
+ authorized access point for place	“Washington, D.C.”
+ punctuation	”)”

String encoding instructions

OPTION

Record a value that includes, in this order:

1. a value that is based on Place: **preferred name of place** 
2. a value of Place: **authorized access point for place**  for the larger place or jurisdiction

OPTION

Apply the string punctuation pattern: "value 1 (value 2, value 3, ...)".

Join each of the second and subsequent values with a comma followed by a space, and enclose the string in parentheses.

String de-construction

Each element is uniquely indicated

Can be 'parsed out' of the string to obtain original value of the element

Element indication may be:

Punctuation (e.g. comma before *date of publication*)

Not enough punctuation symbols?

Name/value pairs (e.g. *date of publication: 2019*)

User friendly? Browseable?

Local SES

May contain non-RDA elements

Output is just a string

May re-use a punctuation pattern

Or use a local pattern

May have a de-constructor

Round trip, or one way

Managing customization

Organization of development and maintenance

Documentation

Synchronization with changes in RDA

Now what?
